

Automated Loading of Contracts

Revolutionary technology changes the way CMS's load contracts

One of the most demanding and costly tasks facing companies implementing contract management systems today is loading existing contracts into the system.

Take, for example, a large organization with thousands, or tens of thousands, of contracts. Loading each contract can take several hours, requires a knowledgeable worker, and is fraught with the potential of manual input errors. **The costs, time, and resources required for loading contracts can be prohibitive.**

Scio's **Solver**, an Automated Contract Analysis System, captures the full meaning of contracts - not only what contracts say, but also what contracts imply - in a fully automated process, directly from the contract documents.

The **Solver** sends the captured contract data into structures that can be mapped to fields and entities used by other CM systems, and populates them, partially or fully- automatically.

“Scio’s Solver can save organizations millions of dollars simply by reducing the time and resources to load a contract into CMS.”

Roy Manoff, CEO
Scio Systems

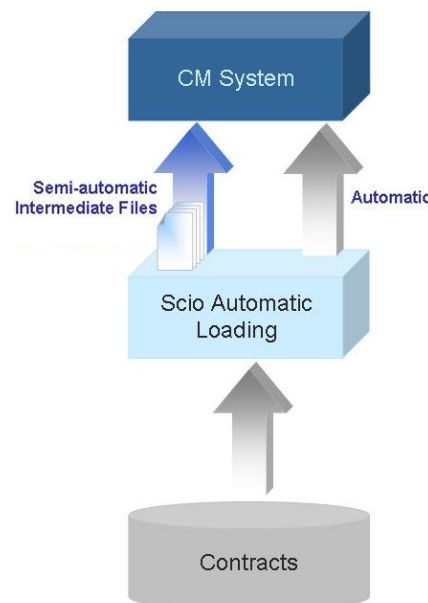

Scio's system uses a unique distributed constraint-reasoning, knowledge-based approach, combining tightly integrated grammatical and semantic analysis.

Benefits to the CMS provider:

- Dramatically accelerate and improve the implementation process
- Legacy and externally-created contracts can now be included within the CMS
- Reduce costs necessary for loading contract data

Reduce potential for human-input error based on data loading.

How it works

Contact us to find out how Scio Systems and **Solver** can be integrated into your mission-critical applications.
